Shelby County Health Department
Air Pollution Control
1826 Sycamore View Road
Memphis, TN 38134

RE: Public Comments on Air Permit Application for Ideal Chemical and Supply Company

Dear Mr. Khokhar:

The Southern Environmental Law Center, Memphis Community Against Pollution, Young Gifted & Green, and the Chickasaw Group of the Tennessee Chapter of the Sierra Club (hereinafter “Commenters”) hereby submit public comments on the September 4, 2024, air permit application from Ideal Chemical and Supply Company (hereinafter “Ideal Chemical” or “the facility”), which is currently out for public notice and comment with the Shelby County Health Department (SCHD).¹ The facility is a wholesale chemical distributor located at 4025 Air Park Street Memphis, Tennessee.

On September 29, shortly after Hurricane Helene passed through Conyers, Georgia, a fire ignited at a BioLab facility and set off a chemical reaction, sending a plume of chlorine gas into the air.² In response, nearly 17,000 residents had to evacuate their homes and another 90,000 residents were asked to shelter in place.³ The chemical disaster at BioLab came about despite warnings in the form of similar accidents at that plant, a report investigating a similar incident at a BioLab facility in Louisiana,⁴ and calls from the Chemical Safety Board (“CSB”) for increased safety protocols to account for risks from climate change.⁵ In light of the recent Biolab chemical disaster in Conyers, Georgia, we are asking Shelby County to act with the utmost caution to protect residents from a similar incident in Memphis.

Ideal Chemical’s now expired permit describes 44 storage and processing tanks storing various chemicals, including VOCs. The facility is permitted as a minor source under Title V and an area source of hazardous air pollutants (HAPs). This application is for a permit renewal without any changes; Ideal Chemical claims they maintain the same processes and products. As discussed

¹ Letter from Nick Ridge, Regul. Affairs Manager, Ideal Chemical and Supply Co., to Jeffery Grill, Engineer, Major Sources Branch, Shelby Cnty. Health Dept. (Sept. 4, 2024) [hereinafter “Ideal Chemical Permit Application”], (Attachment 1).

⁴ U.S. CHEM. SAFETY & HAZARD INVESTIGATION BD., NO. 2020-05-I-LA, TRICHLOROISOCYANURIC ACID REACTION, DECOMPOSITION, AND TOXIC GAS RELEASE AT BIO-LAB, INC. (Apr. 24, 2023), https://www.csb.gov/assets/1/6/biolab_investigation_report_2023-4-24.pdf.

⁵ U.S. GOV’T ACCOUNTABILITY OFF., GAO-22-1044494, CHEMICAL ACCIDENT PREVENTION: EPA SHOULD ENSURE REGULATED FACILITIES CONSIDER RISKS FROM CLIMATE CHANGE (2022).

below, Ideal Chemical's permit application requires further detail as the proposed application is not the same as the current permit. Additionally, in order to protect the citizens of Memphis, SCHD should conduct regular inspections to ensure that the facility is operating safely to prevent a chemical disaster.

I. Ideal Chemical's application does not reflect a permit renewal without change to process or products.

Ideal Chemical's brief letter accompanying their permit renewal application states that the facility requests "renewal of the operating permits as they were previously issued."⁶ However, there seems to be an accounting error in the application. The previous application lists 44 tanks, numbered one (1) to thirty-nine (39), including non-integers, fourteen of which are listed as permitted.⁷ The most current application, however, has 39 tanks numbered non-consecutively from one (1) to forty-one (41), and eleven of these tanks are listed as permitted. Further, the letter states that a drawing of the tanks is included with the letter. However, there is no drawing of the tanks in the copy received by SELC as described.

These discrepancies indicate at the very least that there is insufficient information in the permit application to accurately assess if a renewal of the operating permits, as they were previously issued, is appropriate. The facility states that fewer permitted tanks are operational, and the permit should reflect this change.

II. Shelby County Health Department should conduct site investigations as permitted by the facility's operating permit to maintain a safe and clean facility and to prevent any potential chemical disasters.

Ideal Chemical distributes a vast offering of chemicals, as described on their website.⁸ The facility has an EPA-required risk management plan (RMP) for ammonia.⁹ However, the facility also handles chemicals that do not require a RMP by EPA, despite calls from the Chemical Safety Board to include these chemicals as hazardous and highly reactive chemicals requiring an RMP.¹⁰ The BioLab facility in Conyers, Georgia did not have a RMP.¹¹ The chemical involved, trichloroisocyanuric acid (TCCA), caused the fire and release of chlorine gas, but TCCA does not require a risk management plan by EPA.¹²

¹⁰ U.S. CHEMICAL SAFETY & HAZARD INVESTIGATION BOARD, NO. 2003-15-D, INCIDENT DATA REACTIVE HAZARD INVESTIGATION (2003), (**Attachment 5**).

¹¹ *Supra* note 2, *Schwenk*.

¹² *Id.*; see also ENV'T. PROT. AGENCY, *List of Regulated Substances under the Risk Management Program* (June 5, 2024), <https://www.epa.gov/rmp/list-regulated-substances-under-risk-management-program>.

In a 2003 report, the CSB investigated 167 chemical incidents listing the chemicals involved and highlighting those that do not require an RMP.¹³ A number of the chemicals in that report are handled by Ideal Chemical, namely: sodium hydrosulfite, acetic anhydride, aluminum chloride, and sodium hypochlorite, which is listed to be on site in tank 14.¹⁴ Sodium hypochlorite decomposes if heated under light, or if it comes into contact with an acid.¹⁵ In the material safety data sheet for another facility, the facility cautions that “use of water spray when fighting fire may be inefficient.”¹⁶ Under any decomposition, sodium hypochlorite releases chlorine gas. Chlorine gas is the chemical released at BioLab that required evacuation and shelter in place orders in the community. Shelby County Health Department must ensure that these chemicals are handled properly at Ideal Chemical.

The BioLab facility had other chemical incidents. Maya Nye of Coming Clean, a nonprofit working in chemical industry oversight, stated “We know that when there are multiple incidents at a facility, it’s more likely that another incident is going to occur . . . It’s a sign that there will be another one. It’s just a matter of when.”¹⁷ Therefore, a facility with past violations should be more closely monitored to protect the community.

Though Ideal Chemical has not had a disaster on the scale of those at BioLab, it has had a history of noncompliance with environmental and safety regulations. In September of this year, Ideal Chemical received an informal warning from Shelby County Health Department for a clean air act violation, for failure to timely renew their operating permit.¹⁸ According to the Bureau of Labor Statistics, Ideal Chemical has consistently had a higher incidence rate of nonfatal workplace injuries under OSHA than other facilities under the same NAICS codes for 2022.¹⁹ Further, in 22 inspections on Ideal Chemical’s trucks from 2022-2024, the Federal Motor Carrier Safety Administration found seven (7) violations for improper handling of hazardous materials. Ideal Chemical has had a pattern of negligence resulting in injuries and chemical safety violations. Ideal Chemical and the Memphis community could benefit from additional oversight to ensure compliance with environmental and safety regulations.

Finally, Shelby County has the authority to inspect Ideal Chemical to ensure compliance and safety. In order to carry out the Memphis Air Pollution Control Code, health department employees are “permitted at all reasonable times to enter into any manufacturing plants, business

buildings or other buildings, and all lots, grounds and premises, in order to thoroughly examine any items in relation to public health and air pollution thereon and therein.”²⁰

In order to keep Memphians safe from the threat of a chemical disaster, Shelby County should ensure compliance with environmental and safety regulations at Ideal Chemical.

III. Shelby County Health Department should consider the cumulative impact on the health of Memphians.

SCHD hasn’t yet incorporated cumulative impact analysis officially into their air permitting decision-making framework; however, in a May 2023 newsletter, Shelby County Health Department pledged their “commit[ment] to creating cleaner air for everyone by righting historic wrongs and integrating environmental justice into all programs, policies and activities.”²¹ Cumulative impacts analysis has been held out as a powerful tool to correct environmental injustice. The EPA guidance, *Legal Tools to Advance Environmental Justice*, points out that cumulative impacts have been a concern of environmental justice communities for decades.²² SCHD should incorporate cumulative impact analysis into their permitting decisions to protect Memphians.

Other local permitting authorities have already opted to incorporate cumulative impact analysis into their decisions. Massachusetts has required its permitting authority to consider cumulative impact in their analysis of air quality permits.²³ In 2023, twelve states proposed legislation attempting to address cumulative impacts of pollution acknowledging the increased burden of pollution on People of Color, low-income, and limited English proficiency communities.²⁴ This is in line with EPA’s recent guidance on how to incorporate cumulative impact analysis into all permitting decisions.²⁵ When discussing cumulative impacts from hazardous air pollutants, the EPA guidance states that EPA is required “to assess risk to public health that remains after implementation of a National Emission Standard for Hazardous Air Pollutants . . . and to determine whether additional standards. . . are necessary to provide ample margin of safety to protect public health.”²⁶

²⁶ *Id.* at 9.

The community around Ideal Chemical is subject to the burden of many air pollution sources. According to EJScreen, in the two-mile radius surrounding the facility, there are 22 sources of air pollution reporting to EPA.²⁷ Additionally, the community is burdened by air pollution from the Memphis International Airport, which is the second-busiest cargo airport in the World.²⁸ All of these sources affect the air quality in the community; EJScreen reports that the EJ index for toxic releases to air are in the 97th percentile nationally and RMP facility proximity is in the 95th percentile nationally.

EPA guidance states that non-pollutant stressors also contribute to cumulative impacts and include “indicators of sensitive populations . . . and socioeconomic factors.”²⁹ The two-mile ring surrounding the facility is predominately people of color at 94%.³⁰ Additionally, the unemployment rate in the same 2-mile ring is considerably higher than the state and national average at 13%.³¹ This facility is one of many air pollution sources around the Airport. In order to back up the Department’s commitment to environmental justice, the impacts of this facility must be considered cumulatively.

Conclusion

We appreciate the opportunity to provide input on Ideal Chemical and Supply Company’s air permit application. As discussed above, however, the facility has not accurately accounted for differences between this application and their last permit. Further, SCHD should ensure that environmental and safety regulations are met through regular inspections in order to protect the community from harm of a possible chemical disaster. In order to consider environmental justice, SCHD should consider the cumulative impacts of all nearby air pollution sources before permitting this facility. Finally, we ask that SCHD provide notification of any future actions related to this facility, as well as SCHD’s response to the comments, to the undersigned.

**RE: Permit to Operate Renewal Request
Ideal Permits 00421-01P and 00421-08P**

Mr. Grill,

Enclosed please find applications to renew Ideal's operating permits numbered 00421-01P and 00421-08P. I have also enclosed a drawing and list of tanks and contents.

We are requesting renewal of the operating permits as they were previously issued, our operation has not changed in the last several years. We still maintain the previous processes and products. The last three reporting years were as follows:

Description	PM		VOC		Total HAP		Max Single HAP	
	(lbs)	(tons)	(lbs)	(tons)	(lbs)	(tons)	(lbs)	(tons)
2021	2,715.60	1.36	3,987.52	1.99	406.15	0.20	0.39	0.00
2022	2,567.25	1.28	3,750.29	1.88	88.67	0.04	0.07	0.00
2023	2,715.60	1.36	3,469.99	1.73	54.51	0.03	0.07	0.00
Annual Permit Limits		25.54		15.33		<25		<10

If you have any questions please contact me.

COMPANY ADDRESS: 4025 Air Park Street, Memphis, TN 38118

ISSUANCE DATE: 9/20/2019

PERMIT NUMBER: 00421-08P

EXPIRATION DATE: 9/20/2024

SOURCE DESCRIPTION

Batch Liquid Mixing Process and Loading of Liquid Materials from Storage Tank, Mixing Tanks and Tank Trucks to Tank Trucks and Various Sizes of Totes and Containers.

EMISSION POINTS: Non-Stack
(Insignificant Units Storage Tanks)

The holder of this permit shall comply with all conditions contained in this permit as well as all applicable provisions of the City of Memphis Code. A permit condition may be appealed by filing a petition for reconsideration within thirty (30) days after the mailing date of the permit.

This permit may be subject to revocation, suspension, modification or amendment by the Technical Manager for cause including evidence of non-compliance with any of the above; or for any misrepresentation made in the application(s) received 08-23-2018 and supporting data entered therein or attached thereto, or any subsequent submittal or supporting data; or for any alterations affecting the emissions from this source.

This Permit is further subject to and conditioned upon the terms, conditions, limitations, standards, or schedules contained in or specified on the attached 08 pages.

ROBERT ROGERS, PE
TECHNICAL MANAGER POLLUTION CONTROL

Issuance of this permit shall not relieve any owner or operator of the responsibility to comply fully with any other requirements of local, State, or Federal law.

NON TRANSFERABLE

POST OR FILE AT INSTALLATION ADDRESS

DL
W

PERMIT CONDITIONS:

1. This permit is issued for the batch liquid mixing process and loading of liquid materials from storage tanks, mixing tanks, railcars, and tank trucks to storage tanks, tank trucks and a 6,700 gallon mixing tank. *(Storage tanks are listed in Table 1 below.)*
2. The maximum Volatile Organic Compound (VOC) emissions from this source shall not exceed 15.33 tons per any consecutive twelve-month rolling period.
 - a. *These totals include emissions from the batch liquid mixing process and loading of liquid materials from storage tanks, mixing tanks, railcars, and tank trucks to storage tanks, tank trucks and various sizes of totes and containers.*
3. The maximum throughput for the liquid mixing process shall not exceed 20,000 pounds per hour and 20,800 tons per any twelve-month rolling period.

Equipment Description		VOCs Tons/Year (1)
Batch Liquid Mixing Process and Loading of Liquid Materials		11.77
Tanks 1,5,6,10,11, 15, 16,17,18, 19, 20,37,38, and 39	Loading Loss	3.66
Total VOCs		15.33 (2)
HAPS		Single < 10.0 Combined < 25.0

(1) Allowable VOC emissions. (Consecutive 12-month rolling period)
 (2) HAPS are counted within the VOC emissions. The facility will be required to report HAPS emissions and must remain below 10.0 TPY for any single HAP and 25.0 TPY for combined total HAPS.

4. The maximum hazardous air pollutant (HAP) emissions of all operations including insignificant and exempt activities at this facility shall be less than 10.0 tons of any single HAP or 25 tons of any combination of HAPs per consecutive twelve-month rolling period.
5. Records of the monthly throughput for all VOC-containing materials (e.g. solvents) shall be maintained on site for a period of three (3) years from the date of the records and made available to this Department upon request. These records shall contain the necessary data (including HAP and VOC content of the materials) to demonstrate compliance with the limits specified in Condition numbers 2, 3 and 4 of this permit.
6. The permittee is placed on notice that Condition numbers 2, 3 and 4 of this permit contain limitations that allow the permittee to opt-out of the major source operating permit program requirements specified in Section 16-77, Reference 1200-3-9-.02(11) of the Memphis City Code. Failure to abide by these limits will not only subject the permittee to enforcement action by the Department, but it may also result in the imposition of Federal enforcement action by the EPA and the loss of Federal recognition as a conditional minor source.

DL WJ R R

7. Compliance demonstration for each calendar year shall include submitting an annual report, summarizing the consecutive twelve-month rolling period, having the following information:
- (a) Actual material throughput of all VOC and HAP containing materials (actual usage amounts in pounds or gallons)
 - (b) Annual emissions for VOCs and HAPS (with supporting calculations)
 - (c) Density of material in pounds per gallon
 - (d) Molecular Weight
 - (e) Vapor Pressure, psia

Note: This report may coincide with the submittal of the annual emissions report that is required by February 28th of each year. (See Appendix A, Condition No. 16)

8. Visible emissions from this source shall not exceed twenty percent (20%) in opacity (6-minutes average).
9. The facility is subject to additional rules (40 CFR 63, Subpart Kb) for VOCs stored in the 125,000 gallon tank if the true vapor pressure of the stored VOC liquid is greater than or equal to 3.5 kPA (kiloPascals).
10. Current storage tank inventory is listed in Table 1. Exemption or Listing as insignificant emissions is based on the following regulations:
- a. *City of Memphis Code 16-77, Reference the Rules and Regulations of the State of Tennessee 1200-3-9-.04(4) (d) 12. "All storage tanks with a capacity less than 10,000 gallons and all process tanks with a capacity less than 3,000 gallons."*

General permit conditions are attached in Appendix A.

Storage Tanks:

Table 1: Current Storage Tank Inventory

Tank Number	Position	Capacity (gallons)	Construction Material	Current Contents	Installation Date

DL WA RR

APPENDIX A

General Permit Conditions for Synthetic Minor Sources

SECTION I: OPERATIONAL REQUIREMENTS

1. The facility owner or operator shall control dust, fumes, gases, mist, vapors, or any combination thereof in such a manner as to not cause a nuisance in accordance with City of Memphis Code Section 16-88(a).
2. The facility owner or operator shall not cause, suffer, allow, or permit any air contaminant source to be operated without employing suitable measures for the control of the emission of objectionable odors in accordance with City of Memphis Code Section 16-88(b).
3. The facility owner or operator shall not discharge from any source whatsoever such quantities of air contaminant, uncombined water, or other materials, which cause a traffic hazard, in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.03(3)].
4. The facility owner or operator shall not cause, suffer, allow, or permit any materials to be handled, transported, or stored; or a building, its appurtenances, or a road to be used, constructed, altered, repaired or demolished without taking reasonable precautions to prevent particulate matter from becoming airborne, in accordance with City of Memphis Code Section 16-89.
5. The open burning of residential, commercial, institutional, or industrial solid waste is prohibited except as specified in this permit or in City of Memphis Code Section 16-50.
6. Air contaminant sources must take all reasonable measures to keep emissions to a minimum during startups, shutdowns, and malfunctions in accordance with City of Memphis Code Section 16-87 [Reference Rules and Regulations of Tennessee, Rule 1200-3-20-.02]. These measures may include installation and use of alternate control systems, changes in operating methods or procedures, cessation of operation until the process equipment and/or air pollution control equipment is repaired, maintaining sufficient spare parts, use of overtime labor, use of outside consultants and contractors, and other appropriate means. Failures that are caused by poor maintenance, careless operation or any other preventable upset condition or preventable equipment breakdown shall not be considered malfunctions, and shall be considered in violation of the emission standard exceeded and this rule.

SECTION II: TESTING REQUIREMENTS

7. The facility owner or operator may be required to conduct or have conducted such tests as are necessary to establish the quantity or identity of air contaminants emitted from an air contaminant source. Such tests shall be conducted in a manner approved in advance by the Technical Manager, in accordance with City of Memphis Code Section 16-85.

8. Whenever the Technical Manager has reason to believe that the emission limits of the regulations set forth herein are being violated, the Technical Manager may require The facility owner or operator to conduct or have conducted at the owner's or operator's expense, tests to determine the emission level of specific air contaminants, in accordance with City of Memphis Code Section 16-85.
9. The facility owner or operator of an air contaminant source to be tested shall provide the Technical Manager at least 30 days prior written notice of any performance test and the test protocol form, except as otherwise specified in a promulgated test method, to afford the Technical Manager the opportunity to have an observer present and to approve the test protocol, in accordance with City of Memphis Code Section 16-85.
10. Performance tests shall be conducted under representative performance conditions of the tested air contaminant source(s) for which compliance is to be demonstrated by the test. Samples shall be taken in such number, duration and location as to be statistically significant and representative of performance conditions for which compliance is to be demonstrated by the test, in accordance with City of Memphis Code Section 16-85. Unless otherwise specified in the test method, each performance test shall be corrected to standard conditions, defined as a temperature of 293 K (68° F) and a pressure of 101.3 kilopascals (29.92 in Hg).
11. The facility owner or operator may be required to retest at the request of the Technical Manager if the maximum production rate that occurred during compliance testing is exceeded by 10 percent or more, in accordance with City of Memphis Code Section 16-86.
12. Unless otherwise specified in the test method, each performance test shall consist of three separate runs using the applicable test method. Each test run shall be conducted for the time and under the conditions specified in the applicable test method. For the purpose of determining compliance with an applicable standard, the arithmetic mean of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances beyond the owner or operator's control, compliance may, upon the Administrator's approval, be determined using the arithmetic mean of the results of the two other runs, in accordance with City of Memphis Code Section 16-85, [Reference the Rules and Regulations of Tennessee, Rule 12003-10].

SECTION III: MONITORING/RECORDKEEPING REQUIREMENTS

13. A log of all malfunctions, startups, and shutdowns resulting in emissions in excess of the standards in the City of Memphis Code or any permit issued thereto must be kept at the facility in accordance with City of Memphis Code Section 16-87 [Reference Rules and Regulations of Tennessee, Rule 1200-3-20-.04]. This log must record at least the following:
 - a) Stack or emission point involved;
 - b) Time of malfunction, startup, or shutdown or when first noticed;

- c) Type of malfunction and/or reason for shutdown;
- d) Time startup or shutdown was complete or time the air contaminant source returned to normal operation; and
- e) The company employee making entry on the log must sign, date and state the time of each log entry. The information under items (a) and (b) above must be entered into the log by the end of the shift during which the malfunction, startup, or shutdown began.

All information shall be entered in the log no later than twenty-four (24) hours after the startup or shutdown is complete, or the malfunction has ceased or has been corrected. Any later discovered corrections can be added in the log as footnotes with the reason given for the change.

SECTION IV: REPORTING/NOTIFICATION REQUIREMENTS

14. When any air contaminant source malfunctions in such a manner as to cause the emission of air contaminants in excess of the applicable emission standards contained in Division 1200-3 or any permit issued thereto, or of sufficient duration to cause damage to property or public health, The facility owner or operator of the air contaminant source shall promptly notify the Technical Manager of such malfunction and provide a statement giving all pertinent facts, including the estimated duration of the malfunction, in accordance with City of Memphis Code Section 16-87 [Reference Rules and Regulations of Tennessee, Rule 1200-3-20-.03]. Violations of the visible emission standard (excluding visible emissions caused by hazardous air pollutants named in Chapter 1200-3-11), which occur for less than 20 minutes in one day (midnight to midnight) need not be reported. Prompt notification will be within 24 hours of the malfunction and shall be provided by telephone to the Shelby County Health Department, Pollution Control Section.
15. The Technical Manager shall be notified when the malfunction has been corrected, in accordance with City of Memphis Code Section 16-87 [Reference Rules and Regulations of Tennessee, Rule 1200-3-20-.03]. In attainment and unclassified areas if emissions other than from sources designated as significantly impacting on a nonattainment area in excess of the standards will not and do not occur over more than a 24-hour period (or will not recur over more than a 24-hour period) and no damage to property and or public health is anticipated, notification is not required. Any malfunction that creates an imminent hazard to health must be reported by telephone immediately to the Shelby County Health Department, Pollution Control Section and the Emergency Management Agency.
16. The facility owner or operator shall submit a report to the Department, on an annual basis, that establishes the amount of actual emissions of each regulated pollutant for the facility according to the provisions in City of Memphis Code Section 16-98. This report shall be submitted no later than February 28th of each calendar year and shall include emissions that occurred during the previous calendar year.

SECTION V: MISCELLANEOUS GENERAL REQUIREMENTS

17. The facility owner or operator shall apply for a permit renewal at least sixty (60) calendar days prior to the expiration of this permit in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.02(3)(a)].
18. The facility owner or operator shall pay fees in accordance with City of Memphis Code Sections 16-93 through 16-96.
19. This permit is not transferable from one person to another person, nor from one air contaminant source to another air contaminant source, nor from one location to another location pursuant to City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.03(6)].
20. The facility owner or operator shall maintain this operating permit readily available for inspection by the Technical Manager or his/her designated representative on the operating premises. A person required by regulations to have one or more operating permits shall keep at least one operating permit prominently and conspicuously displayed on the operating premises in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.02(5)].
21. The Shelby County Health Department in conjunction with the Memphis and Shelby County Air Pollution Control Board shall have authority, at their option, to institute and litigate proceedings for violations as set out therein, in accordance with City of Memphis Code Section 16-57. Any person who knowingly:
 - a) Violates or fails to comply with any provision of the City of Memphis Code, any board or administrative order or any permit condition;
 - b) Makes any false material statement, representation, or certification in any record, report, plan or other document required by permit to be either filed or maintained;
 - c) Falsifies, tampers with, renders inaccurate or fails to install any monitoring device or method required to be maintained or followed; or
 - d) Fails to pay a fee

commits a Class C misdemeanor pursuant to the Tennessee Code Annotated with the fine not to exceed ten thousand dollars (\$10,000) per day per violation. For the purpose of this section, each day of continued violation constitutes a separate offense and is punishable as such.

22. The facility owner or operator of any air contaminant source shall be responsible for complying with emission regulations as contained in other chapters of these regulations at the earliest practicable time and for this purpose the Board shall have the authority and responsibility to require compliance with these regulations at an earlier date than indicated where such earlier compliance may reasonably be accomplished, in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.03(1)].

23. The facility owner or operator shall not use any plan, activity, device or contrivance which the Technical Manager determines will, without resulting in an actual reduction of air contaminants, conceal or appear to minimize the effects of an emission which would otherwise constitute a violation of these Regulations, in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.03(2)]. Methods considered circumvention of the regulations include but are not limited to the following:
- a) Air (or other gases) introduced for dilution purposes only; or
 - b) The staggered installation and operation of a facility to avoid coverage by a standard that applies only to operations larger than a specified size.
24. The Technical Manager may suspend or revoke any construction or operating permit if the permit holder fails to comply with the provisions, stipulations, or compliance schedules specified in the permit; all provisions of these regulations; and all provisions of the Tennessee Air Quality Act, in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.03(7)]. Upon permit suspension or revocation, if the permit holder fails to take remedial action, he shall become immediately subject to enforcement actions prescribed by law.
25. Failure to comply with any of the provisions of the City of Memphis Code shall constitute a violation thereof and shall subject the person or persons responsible therefore to any and all of the penalties provided by law, in accordance with City of Memphis Code Section 16-57.
26. For the purpose of carrying out the requirements of the City of Memphis Code, the Technical Manager or his/her authorized representatives shall be permitted at all reasonable times to enter into any manufacturing plants, business buildings or other buildings, and all lots, grounds and premises, in order to thoroughly examine any items in relation to public health and air pollution thereon and therein, in accordance with City of Memphis Code Section 16-61.
27. The facility owner or operator shall not begin the construction of a new air contaminant source or the modification of an air contaminant source which may result in the discharge of air contaminants without first having applied for and received from the Technical Manager a construction permit for the construction or modification of such air contaminant source, in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.01(1)(a)], except as specifically exempted in Rule 1200-3-9-.04 or excluded in subparagraph 1200-3-2-.01(1)(aa) or subparagraph 1200-3-2-.01(1)(cc).
28. The application for a construction permit shall be made on forms available from the Technical Manager not less than ninety (90) days prior to the estimated starting date of construction in accordance with City of Memphis Code Section 16-77 [Reference Rules and Regulations of Tennessee, Rule 1200-3-9-.01(1)(b)]. Sources identified in Paragraph 1200-3-9-.01(4) shall make application for a construction permit not less than one hundred twenty (120) days prior to the estimated date of construction.

Section 1. Registration Information

Source Identification

Facility Name:	Ideal Chemical & Supply Co. - Memphis Facility
Parent Company #1 Name:	Ideal Chemical & Supply Co.
Submission Type:	Resubmission
Receipt Date:	July 2021

Facility Identification

Facility ID:	1000 0007 4126
--------------	----------------

Dun and Bradstreet Numbers (DUNS)

Facility DUNS:	7040348
----------------	---------

Facility Location Address

Street 1:	4025 Air Park Street
Street 2:	N/A
City:	Memphis
State:	TN
ZIP:	38118
ZIP4:	N/A
County:	Shelby

Facility Latitude and Longitude

Latitude (decimal):	35.038611
Longitude (decimal):	-089.932222

Local Emergency Planning Committee and Regulations

LEPC:	Shelby County LEPC
OSHA PSM:	N/A
EPCRA 302:	Yes
CAA Title V:	N/A

Process Chemicals

Program Level:	Program Level 2 process
Chemical Name:	Ammonia (conc 20% or greater)
CAS Number:	7664-41-7
Flammable/Toxic:	Toxic

Process NAICS

NAICS Code:	42469
NAICS Description:	Other Chemical and Allied Products Merchant Wholesalers

Section 6. Accident History

No records found.

Section 9. Emergency Response

Written Emergency Response (ER) Plan

Community Plan (Is facility included in written community emergency response plan?):	N/A
Facility Plan (Does facility have its own written emergency response plan?):	Yes
Response Actions (Does ER plan include specific actions to be taken in response to accidental releases of regulated substance(s)?):	Yes
Public Information (Does ER plan include procedures for informing the public and local agencies responding to accidental release?):	Yes
Healthcare (Does facility's ER plan include information on emergency health care?):	Yes

Local Agency

Agency Name (Name of local agency with which the facility ER plan or response activities are coordinated):

Memphis Fire Department

Agency Phone Number (Phone number of local agency with which the facility ER plan or response activities are coordinated):

(901) 365-4837

1.0 Background

On September 17, 2002, The U.S. Chemical Safety and Hazard Investigation Board (CSB) unanimously approved a total of 18 recommendations intended to reduce the number of serious industrial accidents caused by uncontrolled chemical reactions. The approval culminated a two-year special CSB investigation, http://www.csb.gov/completed_investigations/docs/DS-Reactives.pdf, into hazards at U.S. sites that manufacture, store, or use potentially reactive chemicals. This hazard investigation examined 167 serious chemical accidents in the U.S. over the last 22 years that have involved uncontrolled chemical reactions. These accidents caused 108 deaths as well as hundreds of millions of dollars in property damage.

The investigation prompted the Board to call on government agencies and industry to improve reactive hazard management. In particular, Occupational Safety and Health Administration (OSHA) and the U.S. Environmental Protection Agency (EPA) were asked to extend their process safety regulations — known as the Process Safety Management standard and the Risk Management Program rule — to better control hazards associated with chemical reactivity.

The Board requested that OSHA broaden the application of the PSM standard to cover both individual chemicals and combinations of chemicals that can undergo hazardous reactions under specific process conditions. The standard currently applies to only 137 listed chemicals, plus a class of flammable substances (there are estimated to be thousands of chemicals in common industrial use). Only 38 of these chemicals are currently covered by the PSM standard because of their reactivity. The CSB investigation documented numerous examples where chemicals that were not listed caused reactions resulting in explosions, fires, or toxic gas releases, often with fatal consequences.

EPA currently does not specifically regulate reactive hazards under its RMP rule. The Board

investigation pointed to numerous examples where reactive accidents had a public or environmental impact. For example, the 1999 Concept Sciences explosion near Allentown, PA, killed a member of the public and damaged nearby businesses. The chemical involved, hydroxylamine, is not covered under the EPA rule.

The Board further called on OSHA to modify the PSM standard by requiring companies to evaluate the potential for hazardous reactions in each covered process. Companies would also be required to consult a wider array of scientific and technical literature on reactivity in compiling process safety information — information that is critical in designing safe processes and in protecting employees from workplace hazards. The Board cited deficiencies in process safety information as a root cause of the 1998 Morton explosion in Paterson, NJ, a reactive accident which injured nine workers and gave rise to the Board's reactive hazard investigation.

EPA and OSHA were also requested to collect additional information on reactive accidents within their respective jurisdictions. CSB staff identified that progress on preventing reactive accidents was hampered by a general lack of reliable data — including information on root causes and lessons learned. They also noted that the tally of 167 reactive incidents was almost certainly an underestimate due to data deficiencies.

Citing inadequacies in existing industry guidance on reactives, the Board called on the American Chemistry Council (ACC), the National Association of Chemical Distributors (NACD), the Synthetic Organic Chemical Manufacturers Association (SOCMA), and the Center for Chemical Process Safety (CCPS) to develop new voluntary codes and standards for controlling reactive hazards. Two of those groups - ACC and SOCMA - were also called on to cooperate with the National Institute of Standards and Technology (NIST) in developing a new national database of reactivity test information. This public database of industrial test data would complement existing knowledge on reactive hazards available from

the published literature.

A critical function of the investigation was the collection and analysis of incident data. This incident data provided the framework for many of the key findings, conclusions, and recommendations of the investigation. After the publication of the report, various stakeholders requested that CSB make the raw data collected as part of the reactive hazard investigation publicly available. The raw data and significant findings from it are presented in this publication.

2.0 Data Sources and Methods

CSB data collection efforts involved searching over 40 data sources, focusing on incidents where the primary cause was related to chemical reactivity. For the purposes of the investigation, an “incident” was defined as a sudden event involving an uncontrolled chemical reaction—with significant increases in temperature, pressure, and/or gas evolution—that has caused, or has the potential to cause, serious harm to people, property, or the environment.

The data search focused on recent domestic incidents (since 1980) where the primary cause was related to chemical reactivity; however, the 1980 cutoff is not intended to diminish the important lessons learned from prior incidents. The search covered both chemical manufacturing (i.e., raw material storage, chemical processing, and product storage) and other industrial activities involving bulk chemicals, such as storage/distribution, waste processing, and petroleum refining.¹ For purposes of the incident search, only reactive incidents that caused serious consequences² were examined.

Sources of incident data included a variety of public-domain databases, technical literature, and news accounts. Appendix A lists the major data sources used to retrieve incident data.

¹ Incidents involving transportation, pipelines, laboratories, minerals extraction, mining, explosives manufacturing, pyrotechnic manufacturing, or military uses are beyond the scope of this investigation, in addition to events involving simple combustion (i.e., rapid reaction of fuel [liquid, vapor, or dust] with oxygen in air).

² Serious consequences are injuries or fatalities, significant property damage, environmental contamination, and offsite evacuation or shelter-in-place.

3.0 Data Limitations

CSB believes that most major reactive incidents that have had high public visibility (e.g., government agency investigations, technical literature, national press coverage), over the 22 year period from 1980 to 2001 were captured within the 167 incidents. However, less severe and near-miss reactive incidents were difficult to capture due to data deficiencies. Thus, the tally of 167 reactive incidents is almost certainly an underestimate. Therefore, the results of the CSB incident data analysis were acknowledged as representing only a sampling of recent reactive incident data. This limitation precluded CSB from drawing statistical conclusions on incidence rates or inferring trends in the number or severity of incidents.

The availability of data was limited because of the following:

- No single data source provides a comprehensive collection of chemical incidents from which to retrieve or track reactive incident data.
- Incident data collected by OSHA and EPA provide no functional capability to track the occurrence of reactive incidents with serious worker or public impacts;³ such data are a valuable resource for analyzing incident trends and developing prevention actions at a national level.
- No one comprehensive data source contains the data needed to adequately understand root causes and lessons learned from reactive incidents or other process safety incidents.⁴

³ Research indicates that the OSHA Integrated Management Information System (IMIS) identified 70 percent of the reactive incidents in Section 3.3, but none were tracked as “reactive incidents.” Only 25 percent of the reactive incidents that occurred from June 1994 through June 1999 were reported to EPA. These reports are contained in the RMP 5-year accident histories sent to EPA prior to the June 1999 deadline for initial submissions.

⁴ Only one publicly available database is designed to provide such information. The Accident Database from the Institution of Chemical Engineers (ICChemE) contains lessons learned for one-fourth of the 12,000 incidents in the database.

- It is difficult to identify causes and lessons learned in existing sources of process safety incident data because industry associations, government agencies, and academia generally do not collect this information.
- Data sources contained incomplete and sometimes inaccurate incident information—for example, on numbers of injuries and community impacts. Descriptions of incidents and causal information were sometimes vague and incomplete.
- There are limited Federal or state requirements to report incidents unless they involve specific consequences.

However, despite these limitations, the data provided useful insights into the profile and causes of reactive incidents.

4.0 Data Analysis Highlights

The following is a list of findings from the analysis of the data collected by CSB:

1. The limited data analyzed by CSB include 167 serious incidents in the United States involving uncontrolled chemical reactivity from January 1980 to June 2001. Forty-eight of these incidents resulted in a total of 108 fatalities. The data include an average of six injury-related incidents per year, resulting in an average of five fatalities annually.
2. Nearly 50 of the 167 incidents affected the public.⁵
3. Over 50 percent of the 167 incidents involved chemicals not covered by existing OSHA or EPA process safety regulations.⁶
4. Approximately 60 percent of the 167 incidents involved chemicals that either are not rated by NFPA or have “no special hazard” (NFPA “0”).⁷ Only 10 percent of the 167 incidents involved chemicals with NFPA published ratings of “3” or “4.”
5. The OSHA PSM Standard lists 137 highly hazardous chemicals—only 38 of which are considered highly reactive based on NFPA instability ratings of “3” or “4.”
6. Reactive hazards are diverse. The reactive incident data analyzed by CSB included:
 - Over 40 different chemical classes (i.e., acids, bases, monomers, oxidizers, etc.), with no single dominating class.

⁵“Public impact” is defined as known injury, offsite evacuation, or shelter-in-place.

⁶ OSHA PSM Standard (29 CFR 1910.119) and EPA Accidental Release Prevention Requirements: Risk Management Programs (RMP) Under the Clean Air Act, Section 112(r)(7) (40 CFR 68).

⁸An NFPA instability rating of “0” means that materials in themselves are normally stable, even under “fire” conditions.

-
- Several types of hazardous chemical reactivity, with 36 percent attributed to chemical incompatibility, 35 percent to runaway reactions, and 10 percent to impact-sensitive or thermally sensitive materials.
 - A diverse range of chemical process equipment—including reaction vessels, storage tanks, separation equipment, and transfer equipment. Storage and process equipment (excluding chemical reaction vessels) accounts for over 65 percent of the equipment involved; chemical reaction vessels account for only 25 percent.
7. Reactive incidents can result in a variety of consequences, including fire and explosions (42 percent of incidents) as well as toxic gas emissions (37 percent).
 8. Causes and lessons learned are reported in only 20 percent of the 167 incidents. (Industry associations, government agencies, and academia typically do not collect this information.) However, more than 60 percent of the incidents for which some causal information was available involved inadequate practices for identifying hazards or conducting process hazard evaluations; nearly 50 percent involved inadequate procedures for storage, handling, or processing of chemicals.¹¹
 9. Over 90 percent of the incidents analyzed by CSB involved reactive hazards that are documented in publicly available literature accessible to the chemical processing and handling industry.
 10. Approximately 70 percent of the 167 incidents occurred in the chemical manufacturing industry. Thirty percent involved a variety of other industrial sectors that store, handle, or use chemicals in bulk quantities.

¹¹The summation of causal factor statistics exceeds 100 percent because each major incident can, and often does, have more than one cause.

5.0 Reactive Incident Data

The reactive incident data collection effort was comprehensive. It took nearly 6 months to complete. As stated in Section 2.0, over 40 data sources were examined. These include a variety of public-domain databases, technical literature, and news accounts. In certain cases, incident investigation reports from companies were requested (voluntary submission) and interviews with OSHA compliance officers were conducted to obtain detailed information (e.g., initiating event, management system deficiencies).

Reactive incidents that met the CSB definition and were within criteria limits (e.g., non-transportation, non-military) were collected. CSB staff ensured that each incident had a unique date and location to minimize double counting of incidents. To further ensure data quality, a contractor was hired to review CSB data collection procedures, collected data and the CSB data analysis.

Table 1 presents the raw reactive incident data collected as part of the reactive hazard investigation.

Table 2 provides a brief description of each data field.

Disclaimer: The contents of this data set are not a comprehensive listing of all reactive incidents that have occurred. This data was compiled from a variety of existing sources, which are inadequate to fully identify the frequency and causes of reactive incidents. Therefore, this data may be of limited usefulness for drawing statistical conclusions on incidence rates or inferring trends in the number or severity of incidents. Although the CSB is committed to gathering and disseminating accurate information, the CSB was unable to independently verify all information contained in the various data sources. These sources, especially those based on initial incident reports, may contain incomplete or inaccurate information. Users of this data are requested to attach this disclaimer to the data and cite the CSB as the source. No CSB endorsement of or agreement with third-parties' analysis or conclusions should be implied from or suggested by those parties' use of this data.

Table 2. Data field description of reactive incident data

Data Field	Description
ID #	Number given to track.
Date	Date of incident.
Location	Location of incident.
Company	Facility owner.
Chemicals	Chemicals involved in incident.
Chemical 1 Class	Chemical class for chemical 1.
Chemical 1 NFPA Number from 49/325	NFPA rating given in standard 49 or 325 for chemical 1.
Chemical 2 Class	Chemical class for chemical 2.
Chemical 2 NFPA Number from 49/325	NFPA rating given in standard 49 or 325 for chemical 2.
Type of Reaction	Type of reaction that caused the incident.
Known/Unknown Chemistry	Was knowledge of the chemical reaction involved in incident available in open literature?
Equipment Involved	Equipment where the reaction occurred.
Facility Type	Prominent business operation conducted at facility involved in incident (e.g., chemical manufacturing).
Fatality	Number of fatalities resulting from the incident.
Injury	Did the incident result in an injury?

Property Damage (\$)	Did the incident result in property damage? And 12 incidents with largest costs regarding property damage.
Consequences	Type of consequences from the incident (e.g., toxic gas release, fire & explosion).
Public Impact	Did incident impact member of public? Public impact is fatality, injury, evacuation, or shelter-in-place of a member of the public.
Reactive Hazards	Classification of the type of reaction involved in the incident.
Management System Deficiencies	Deficiencies in management systems that contributed to the incident. In most cases, this information was not determined by CSB.
OSHA PSM List	For the purposes of analyzing the data, CSB determined if a chemical was covered by OSHA PSM by identifying whether it was listed in PSM or was covered as a flammable chemical by OSHA definition.
EPA RMP List	For the purposes of analyzing the data, CSB determined if a chemical was covered by EPA RMP by identifying whether it was listed in RMP.
Data Sources	Primary sources used to obtain information regarding the incident.

COMMUNITY INFORMATION

BREAKDOWN BY RACE

BREAKDOWN BY AGE

LIMITED ENGLISH SPEAKING BREAKDOWN

Notes: Numbers may not sum to totals due to rounding. Hispanic population can be of any race. Source: U.S. Census Bureau, American Community Survey (ACS) 2018-2022. Life expectancy data comes from the Centers for Disease Control.

Report for 2 miles Ring Centered at 35.038781,-89.932140
 Report produced October 31, 2024 using EJScreen Version 2.3

Environmental Justice & Supplemental Indexes

The environmental justice and supplemental indexes are a combination of environmental and socioeconomic information. There are thirteen EJ indexes and supplemental indexes in EJScreen reflecting the 13 environmental indicators. The indexes for a selected area are compared to those for all other locations in the state or nation. For more information and calculation details on the EJ and supplemental indexes, please visit the [EJScreen website](#).

EJ INDEXES

The EJ indexes help users screen for potential EJ concerns. To do this, the EJ index combines data on low income and people of color populations with a single environmental indicator.

EJ INDEXES FOR THE SELECTED LOCATION

SUPPLEMENTAL INDEXES

The supplemental indexes offer a different perspective on community-level vulnerability. They combine data on percent low income, percent persons with disabilities, percent less than high school education, percent limited English speaking, and percent low life expectancy with a single environmental indicator.

SUPPLEMENTAL INDEXES FOR THE SELECTED LOCATION

Report for 2 miles Ring Centered at 35.038781,-89.932140

Report produced October 31, 2024 using EJScreen Version 2.3

EJScreen Environmental and Socioeconomic Indicators Data

SELECTED VARIABLES	VALUE	STATE AVERAGE	PERCENTILE IN STATE	USA AVERAGE	PERCENTILE IN USA
ENVIRONMENTAL BURDEN INDICATORS					
Particulate Matter 2.5 (µg/m ³)	9.11	7.52	98	8.45	77
Ozone (ppb)	60	56.6	90	61.8	48
Nitrogen Dioxide (NO ₂) (ppbv)	9.2	6.1	90	7.8	67
Diesel Particulate Matter (µg/m ³)	0.203	0.156	72	0.191	64
Toxic Releases to Air (toxicity-weighted concentration)	5,200	5,300	77	4,600	86
Traffic Proximity (daily traffic count/distance to road)	1,500,000	590,000	87	1,700,000	65
Lead Paint (% Pre-1960 Housing)	0.14	0.21	52	0.3	41

Over Age 64	8%	18%	15	18%	18

*Diesel particulate matter index is from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the Air Toxics Data Update can be found at: <https://www.epa.gov/haps/air-toxics-data-update>.

Sites reporting to EPA within defined area:

Superfund	0
Hazardous Waste, Treatment, Storage, and Disposal Facilities	5
Water Dischargers	63
Air Pollution	22
Brownfields	0
Toxic Release Inventory	23

Other community features within defined area:

Schools	9
Hospitals	2
Places of Worship	26

Other environmental data:

Air Non-attainment	Yes
Impaired Waters	Yes

Selected location contains American Indian Reservation Lands*	No
Selected location contains a "Justice40 (CEJST)" disadvantaged community	Yes
Selected location contains an EPA IRA disadvantaged community	Yes
